

Abstract

An isolation cell for transporting inmates, and a method of loading and unloading the inmates from the cell. The isolation cell features a number of separate compartments for holding inmates. Once in the compartments, the 5 inmates are isolated to be out of contact with the other inmates within the cell. A number of interior walls are positioned throughout the cell to form the separate compartments. One or more of the interior walls are movable between first and second positions. In the first positions, the interior walls are moved in a manner for the inmates to be loaded and unloaded from the compartments. In the 10 second positions, the interior walls are locked to complete the compartments and securely isolate the inmates.
